

SERVER TESTING TOOL

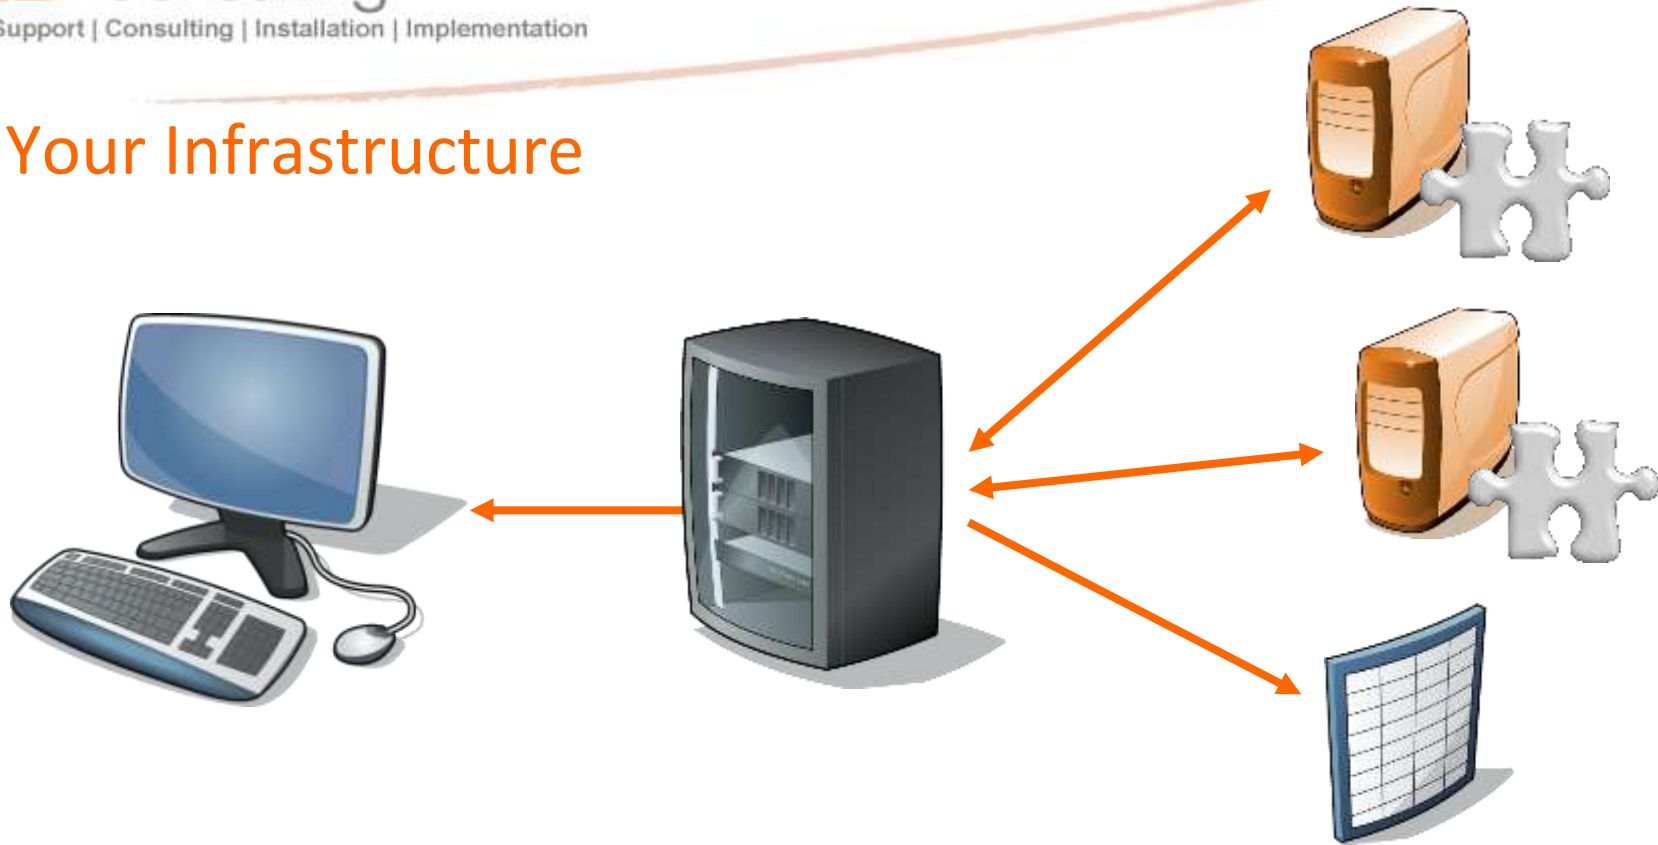

Infrastructure Testing and Reporting Tool

Testing Server

- The application can be hosted on a Windows, Unix or Linux based machine as long as it is running Java 1.6.0.x and has access to a mail server. (or the internet to connect to an external mail server)
- The testing server can email the failure reports to specific recipients
- The testing server can offer a command-line interface to administrators to check (and recheck) particular servers/databases
- The testing server can act as an intranet server to serve up a dashboard view of the overall infrastructure health.

Your Infrastructure

❖ The Server Testing Tool can:

- Ping servers
- Report on database status
- Report on database auto extend situation
- Report on database tablespace free area
- Report on database invalid objects
- Report on outstanding database alerts (such as flashback reports)

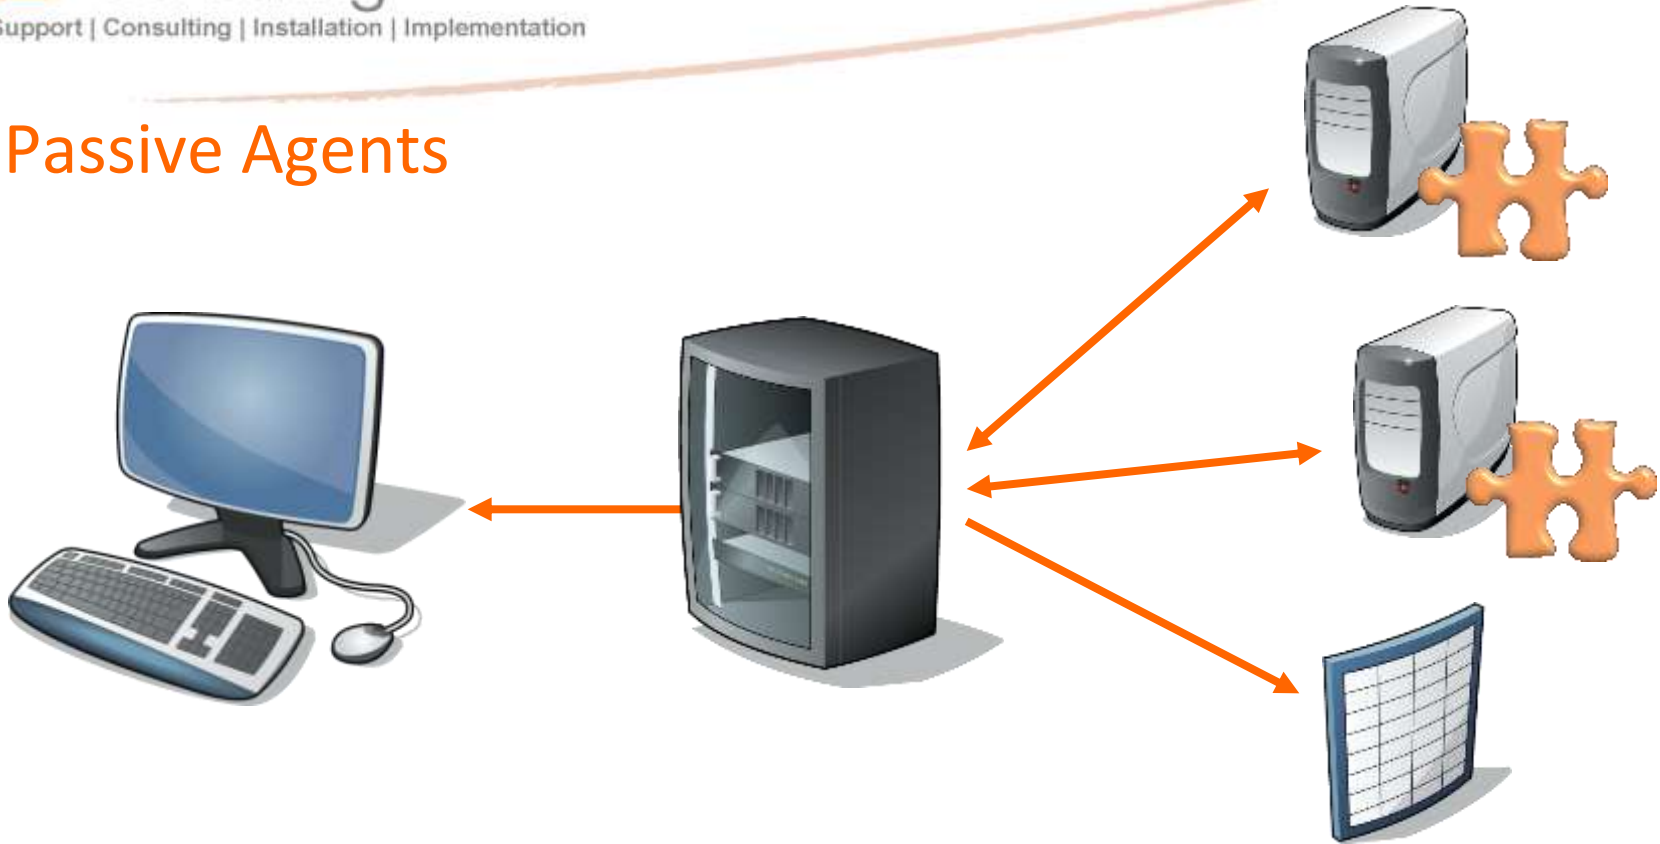

❖ The Server Testing Tool supports the following operating systems:

- Microsoft Windows 200x, XP, Vista
- HP Unix
- Linux (Tested on SUSE and Red Hat)

❖ The Server Testing Tool supports the following databases:

- Oracle
- Microsoft SQL Server
- MySQL (planned)

Passive Agents

- Optional passive agents can be installed on your servers (Windows, HPUX and Linux)
- These agents do not sit and collect data repeatedly on your servers – they only query information when requested to do so.
- These agents can provide additional hardware level information, such as disk utilization, space requirements, etc.
- Feedback from these agents is collected via the standard Server Monitor frontend and feeds seamlessly into the dashboard and email system.
- Agent versions are checked and automatically reported ensuring that the latest version are running in your organization.

Dashboard

- An intranet based dashboard can be utilised, within a call center perhaps, to monitor critical issues
- The data will be automatically updated by the Server Testing Tool at user defined intervals and, as an intranet application, can be viewed anyway within the organization.
- The display is colour coded to allow warnings and error conditions to be easily identified.
- The Dashboard is an optional feature which adds no overhead to the monitor or servers/databases within the organization.

Feedback

- By default the Server Testing Tool e-mails failure reports to designated email addresses when a full test is run.
- The email details potential issues could cause catastrophic failure if not attended to.
- The email the failure reports to specific recipients at predefined intervals, eg. 06h30 so that “fires” can be put out the moment administrators start their day.
- Emails can be sent to external addresses for remote administrators to attend to issues, before they become problems.

THANK YOU

“get IT done right”
